Müthing: Professional mulching technology for international markets

Müthing is setting new standards in the international market with its new Pro/R Vario flail mower series. The series combines the familiar quality of Müthing Vario flail mowers with customised equipment for global requirements.

The Müthing (MU) Pro Vario series sets standards in professional harvest residue management. The well-equipped machines are the market leader among professional users in Germany and neighbouring countries. In order to meet the demand on international markets for a rear-only flail mower without side shift, the company from Soest, Germany, has added the Pro/R Vario models to the Pro series.

The model range comprises three working widths of 2.80, 3.00 and 3.20 m. These machines are designed as implements for rear-only attachment with category 2 and 3 coupling points. Designed for tractors from 95 to 250 hp, the machine covers a broad portfolio of possible tractor vehicles, depending on the requirements and conditions on site. The machine is built from tried-and-tested components from the long-established company from Soest, Germany, that are proven under professional use. Thanks to the MU-Vario® system fitted as standard, the shredding rate and the suction effect can be individually adapted via the cutting bar to different crops, such as rape, grain stubble, maize, catch crops or grassland. The adjustment possibilities of the Vario cutting bar also allow the power requirement and fuel consumption to be influenced in order to meet changing needs. Side wear runners made of Hardox steel and an internal wear insert are included as standard and ensure that the machine operates reliably and retains its value.

The machine is optionally available with a vertically adjustable support roller or field chassis with pneumatic tyres. The large support roller ensures good rolling behaviour and precise height control on uneven terrain thanks to its position close to the rotor. The optional field chassis, on the other hand, improves steering capability with a swivel angle of 180° and offers advantages in long-stemmed or voluminous crops such as grain maize or sunflowers.

This flail mower has been further optimised for the requirements of international trade: The dimensions and body are optimised for transport in trucks or shipping containers so that trading partners around the world can be supplied with professional equipment "Made in Germany" in a logistically efficient manner.

The Müthing trade fair team at Agritechnica 2025 is looking forward to engaging with international visitors and providing information and assistance on all aspects of mulching at Stand B35 in Hall 11.
